

General Information	
Academic subject	Environmental engineering for sustainable maritime and port activities
Degree course	Maritime-port strategic sciences
Curriculum	
ECTS credits	6
Compulsory attendance	No
Language	Italian

Subject teacher	Name Surname	Mail address	SSD
	Ezio Ranieri	ezio.ranieri@uniba.it	ICAR 03

ECTS credits details	Area	CFU/ETCS
Basic teaching activities	08	6

Class schedule	
Period	I semester
Year	2021-2022
Type of class	Frontal lectures, on line if necessary

Time management	
Hours	150
In-class study hours	48
Out-of-class study hours	102

Academic calendar	
Class begins	Settembre 2021
Class ends	Dicembre 2021

Syllabus	
Prerequisites/requirements	
Expected learning outcomes	<p>Knowledge and understanding on:</p> <p>Knowledge and understanding of the methodological-operational aspects of the basic sciences applied to environmental engineering and of the most relevant applications which have a prevalent employment outlet in the territory and which characterize the activities of the bodies responsible for environmental protection and service companies of environmental design and consultancy, the realization of public and private interventions and works.</p> <p>Applying knowledge and understanding on:</p> <p>Ability to apply their knowledge and understanding of scientific and technological aspects using the tools provided by engineering training, in the field of basic sciences and engineering also plant engineering, to interpret the problems of environmental engineering</p> <p>Making informed judgments and choices:</p> <p>The student acquires the knowledge listed above through the training activities of the courses with theoretical and methodological content provided for the academic subjects, in the comparison with teachers and trainers and in the personal study, carried out individually and with the support of tutors.</p>

	<p><i>Communicating knowledge and understanding</i></p> <p>Ability to apply knowledge and understanding and ability, to the solution of problems of varying complexity in interdisciplinary contexts related to the study sector of environmental protection, specifically connected to environmental mitigation measures, techniques and technologies, the treatment of water and waste and for environmental clean-up. This skill will be such as to master the contents and skills acquired, demonstrating a professional approach and the skills will be adequate to devise and support broad-ranging arguments in the field of environmental engineering, concerning purification, purification, atmospheric pollution, treatment waste and remediation of contaminated sites.</p> <p><i>Capacities to continue learning</i></p> <p>Knowledge and understanding of the aspects of hydraulics, organic and inorganic chemistry aimed at understanding the activities relating to the purification, purification, management and treatment of waste and remediation of contaminated sites; knowledge and understanding of the regulatory and administrative, social and ethical contexts typical of environmental engineering</p>
Contents	<p>The course aims to provide students with the cognitive tools necessary for the definition and application of appropriate environmental protection techniques with particular reference to port areas. The basic legislation will be defined for the interpretation of the phenomena of pollution induced by anthropic activity, with regard to the matrices of water, air, soil and the techniques for cleaning up the territory and port areas. Specifically the topics examined will concern:</p> <p>Pollution phenomenology. Self-purification of water bodies. Supply waters. Wastewater. Wastewater treatment. Solid waste. Sanitary and Environmental Risk Analysis. Remediation techniques for contaminated sites. Dredging. Atmospheric emissions.</p>
Course program	
Bibliography	<ul style="list-style-type: none"> • Masotti L.; La Depurazione delle Acque, Ed. Calderini • Collivignarelli C. Ingegneria Sanitaria Ambientale. Ed Cittàstudi
Notes	None
Teaching methods	Frontal Lectures
Assessment methods	Final examinations
Evaluation criteria	<ul style="list-style-type: none"> • <i>Knowledge and understanding</i> Verification of the achievement of the learning results takes place mainly in the examination tests, oral with possible production of written work, to which an assessment is expressed, expressed by a mark, or the achievement of a suitability. Applying knowledge and understanding • <i>Autonomy of judgment</i> Ability to respond appropriately to technical-application problems inherent to the aspects examined • <i>Communicating knowledge and understanding</i> Ability to express appropriate and inherent assessments • <i>Communication skills</i> Expression with appropriate verbal and figurative language properties • <i>Capacities to continue learning</i> Overall mastery of content and exposure, of all aspects examined in the course.
