## What is Environmental History?

Second Edition

### Introduction

Environmental history studies the mutual relationships of humans and nature through time. Historians and others are active in this field in many parts of the world, the literature is vast and growing, and the subject is taught in schools and universities. Its audiences include students, other scholars, government and business policymakers, and a general public, all interested in environmental issues of great import in the modern world.

But what is environmental history? It is a kind of history that seeks understanding of human beings as they have lived, worked, and thought in relationship to the rest of nature through the changes brought by time. The human species is part of nature, but compared to most other species we have caused far-reaching alterations of the conditions of land, sea, air, and the other forms of life that share our tenure of the Earth. The changes humans have made in the environment have in turn affected our societies and our histories. Environmental historians tend to think that the unavoidable fact that human societies and individuals are interrelated with the environment in mutual change deserves constant recognition in the writing of history.

IN THE  
ANCIENT  
MEDITERRANEAN

# An Environmental History of Ancient Greece and Rome

LUKAS THOMMEN

*Translated by Philip Hill*

CAMBRIDGE

Was there any awareness of environmental problems among intellectuals and politicians of the ancient world? Did they even have notions of 'pollution', 'exploitation', and 'depletion' of natural resources? And what forms did human action take for the protection of the environment?

The authors – from the fields of Ancient History, Classical Archeology, Ancient Laws, and History of Medicine – focus on the en-

vironmental and ecological awareness in the ancient world, both in material evidence of daily life and in the intellectual thought. They analyse if there was a common awareness of environmental and ecological questions, or if there were only a few and isolated measures aimed at the interest of special social groups and at specific political goals. They discuss to which extent the ancient evidence can be used to identify the roots of modern environmental sensitivity.
